DETAILED ACTION***Examiner's Statement of Reasons for Allowance***

1. This action is in reply to applicant's appeal brief correspondence filed of 24 July 2006. Upon further review and consideration of the arguments put forth in the appeal brief, and associated pre-appeal discussions, the examiner finds the applicant's arguments to be persuasive.

2. Claims 1-26, 28 and 29 are allowed over prior art.

3. The following is an examiner's statement of reasons for the indication of allowable claimed subject matter.

4. As per claims 1, 15 and 26 generally, prior art of record, Fischer, U.S. Patent 5,659,617, fails to teach alone, or in combination, other than via hindsight, at the time of the invention, the features as discussed and remarked upon in the response of 7/24/2006 to office action of 1/17/2006.

Specifically, (as per claim 1, for example) prior art dealing with digital/analog signal propagation/timing differences, clock skewing, etc., as applied to generation of cryptographic information in general, and key information more specifically (i.e., 'true random number generator' randomness applications), is known to exist per se, (i.e., Fischer, Viktor, et al, 'SIMPLE PLL-BASED TRUE RANDOM NUMBER GENERATOR FOR EMBEDDED DIGITAL SYSTEMS', IEEE workshop on Design and Diagnostics of Electronic Circuits and Systems, 4/18-21/2004, entire document, www.best.tuke.sk/simka/download/pub/fis_dru_sim_cel_04.pdf). Nowhere in the prior art is found collectively the *italicized* claim elements (i.e., remote source generation of first and second timing signals, the *delay in reception* at a computer used as a basis for key generation as further combined with computer specific '*operating*

environment' identification criteria so as to provide a cryptographic key used for encryption/subsequent decryption), at the time of the invention; serving to patently distinguish the invention from said prior art;

"1. A method for protecting electronic files, comprising:

receiving *first and second timing signals* from

a remote source using a receiver;

computing a delay number, the delay number being

a measure of a variation between

arrival times of the first and

second timing signals at the receiver;

obtaining environment information regarding a computer,

the *environment information including*

the delay number and

data concerning an operating environment of the

computer;

creating an encryption key based on

the environment information; and

encrypting an electronic file using

the encryption key."

5. Dependent claims 2-14, 16-25 and 28-29 are allowable by virtue of their dependencies.
